Introduction

Adolescent is a time of great and rapid physical and psychological growth. This brings with it not only increased nutritional needs but also the emotional needs and the needs to adjust to new attitudes and responsibilities. During this period of their life, adolescents have to pass through a physical and psychological crisis. Many adolescents do not face these conditions or have to choose the way of leaving home and live in street. These children are called street children. Those who have run away from home can further be separated into two categories. First, those who have an unpleasant or traumatic home environment, they experience family problems, finally they become unable to solve the problems like alcoholism, child abuse, ill treatment by stepparent, unemployment and poverty etc. Since their tolerance level goes far exceeded leading to the drastic decision to leave their family. Second type of street children are those who run away from home, who want to study/work but are not allowed and come to experience the exciting feelings of city life, glamorized by magazines and movies.

The definition of 'street children' is contested, but many practitioners and policymakers use UNICEF's concept of boys and girls aged under 18 for whom 'the street' (including unoccupied dwellings and wasteland) has become home and/or their source of livelihood, and who are inadequately protected or supervised (Black, 1993)

Street children may be found on every continent in a large majority of the world's cities. India has 11 million street children. Religion of street children in India varies greatly according to area, but in general, approximately 70% are Hindu, 18% are Muslim, Christian and other.

In a report, WHO offers the following list of causes for the phenomenon:

- Family breakdown
- Armed conflict
- Poverty
- Natural and man-made disasters
- Famine
- Physical and sexual abuse
- Exploitation by adults
- Dislocation through migration
- Urbanization and overcrowding
- Acculturation

Nowadays, parents are usually busy at work or with social engagement and spend lesser time with their children. Psychiatrist Ross Campbell (1983) wrote, "Without focused attention, a teenager experiences increased anxiety, because he feels everything else is more important than he is. He is consequently less secure and becomes impaired in his emotional and psychological growth".

Parents who indulge in physical abuse will by slapping shoving, pushing, beating or shaking their teenager may well harm the young person’s physical development, but for more tragically will malign the teen’s emotional development, which as an adult will make their lives for more difficult.

James Garbarino (1999) “emotionally needy boys and girls who are rejected by teachers and parents, are prime targets for anti-social older youth and adults.”

The emotions of hurt, anger and rejection, which were seldom expressed in childhood, may give rise to low self-esteem, feelings of loneliness, insecurity and depression and abusive behavior, it will be a desperate action to escape from family, school or community crises with which they can not cope. For still others, leaving home represents the only option. David propane (2008) professor of sociology at
Rutgers university and co-chair of council on families in America states “Children develop best when they are provided the opportunity to have warm, intimate, continuous and enduring relationships with both their father and their mother.”

The adolescence’s intellectual, emotional, social, moral and spiritual development are greatly enhance if the adolescence has significant amount of emotion.

So well-development of mental, physical and emotional functioning has evolved using psychospiritual package. This study is an attempt to give a psychospiritual package for the development of the adolescent emotion. This package includes group counseling as psychological variables; asana, pranayama and swadhyaya as yogic variables; meditation with music as music therapy. These all spiritual package are derived from pattern of Acharya Shriram Sharma.

Various evidences are available to support the yogic and psychological techniques as the means of reducing the problems of street children. There is an evidence in which Bodhi, R.Badami (2004) observed the “Work on effectiveness of yoga on adolescent with developmental disabilities and found yoga is very effective for personality development.”

“Practice of psychospiritual package like Asana, pranayama, meditation, swadhyaya, group counseling, cause to train the nervous system and produce physiological balance in different system of the human body and mind. P.R. Sarkar (2007) – Founder of Anada marga yoga society- “explained that by doing specific posture a person could help bring into balance agitated states of mind such as anger, shyness, loneliness, insecurity, fear, intelligence, jealousy etc.”

Pranayama seems to influence autonomic function and cerebral activity electro physiological and cognitive function and help in treating ailment affecting atomic status and mood disorder. Meditation achieves the state of stillness of mind, control over thought and balances the emotions; meditation is a state of concentration of mind reading to higher status of awareness to heightened perception.

Researches have revealed that mediator gains happiness, freedom from anxiety, context with self and grater vitality other articles also suggest that mediators gain enhanced confidence, a sense of self control, empathy and self actualization (Hjelm 1974) in general meditation promises psychological health. (Gaylord et.al.1989, Gelder loos 1956). Meditation decreased anger aroused in high anger situation (Duo & Surinder, 1992)- K.N. Udupa stress & its management by yoga.

One of the parts of psychological tools is group counseling. Group counseling develops a sense of acceptance, satisfaction and experience of empathy and enhance understanding power to know other problems.

By Swadhyaya, adolescent can removes their conflict and re-stables their emotion, feeling etc. With this background, here, a ‘psycho-spiritual package’ has been designed to manage the related problems like loneliness, insecurity and emotional intelligent among street children and encourage them to real life.

---

**Review of Researches**

**According to Area wise – 1. Street Children**

**LewisApteka(1988)**

The characteristics of street children were examined from participant observational data, and from standardized psychological test scores from a sample of 56 male, Colombian street children who ranged in age from 7-16. The Kohs Block Design measured the children's intelligence; the Good
enough-Harris Drawing Test and the Bender Gestalt were used to measure the children's emotional and neurological functioning. The data showed the children were functioning with adequate mental health. Two different preadolescent styles of street life were presented and their peer groups were explained. The present study illustrated how street life altered the children's developmental sequence, but provided them with adequate coping skills. The study demonstrated how child development was changed by personal and cultural circumstances.

**Khurana S, et al. (2004)**

This cross-sectional study was conducted to assess the psychological problems amongst the runaway adolescent boys, and to determine the associated risk factors. 150 runaway adolescents aged 10-16 years staying at the Child Observation Home (COH), Delhi were taken for the sample. The duration of this study was one month i.e. from June to July 2001. Identification data, Hopelessness Scale for Children by Kazdin, Beck Depression Inventory, Psychological survey and Rutter -- B2 technique was used for data analysis. According to Voluntary Health Association of India (VHAII), there are 47.22 million homeless and runaway adolescents roaming on the streets of our country, of whom 1, 00,000 are in Delhi alone. Results showed that nearly 50% of the sample runaway children were from Bihar and U.P., 18.7% from Delhi, and rest were from other states of the country. 71.3% children lived with both parents, 15.3% had single parent family and 6.6% were with their stepparents, before running away from home. Physical abuse had been experienced by 38% children and sexual abuse by 14.6%. 42.9% children were abused by unknown people, 28.5% by family members, and a similar number by the relatives. 55.3% children reported substance abuse. 49.6% children reported tobacco intake, 0.67% reported ganja intake, and 2.66% reported glue sniffing. High degree of hopelessness was seen among 20.7% cases, 12.9% reported having suicidal thoughts, 12.9% had planned suicide at any point of time, and 3.2% children reported attempting suicide. Depression was seen among 8% children. Out of these depressed children, 25% had a history of suicidal thoughts, 16.6% planned suicide, and 8.3% had attempted suicide. Suicidal behaviors were present in 8% children. 4.7% children gave history of ever planning suicide; and 2% reported suicidal thoughts and attempts of suicide. 81% respondents exhibited anti-social behavior, 7.8% were neurotic, and 10.5% remained undifferentiated. Among children living with both parents, behavior problems were observed in 71% cases, while 63.3% children belong to single parent families, and 60% children belonging to families with stepparents, had behavioral problems respectively. Among non-abused children, 68.8% had behavioral problems; while among abused children 70.2% had behavior problems. 22.8% abused children reported feelings of hopelessness, whereas among non-abused children only 19.4% had feelings of hopelessness. 8.8% abused children and 7.6% non-abused children felt depression, respectively. Suicidal behavior was reported in 7.01% cases in the abused group as compared to 14.03% in the non-abused group. It was suggested that there is a need for broad based psychosocial intervention programmes to deal with runaway adolescents, and to improve the accessibility and availability of community mental health services for homeless children.

**Eija Paavilainen, Pavli Åstedt-Kurkpäivi and Marita Paunonen (2006)**

The purpose of this study was to analyse and describe the experiences of adolescents who had been maltreated by their parents in childhood. Child maltreatment was defined as physical, psychological or sexual abuse or neglect caused by parents or other primary caregivers of the child. Data were collected from seven adolescents, aged 14-19 years, who had been maltreated within their family of origin for many years. Interviews employed broad themes pertaining to family life, maltreatment experiences and the family's strengths and problems. The data were analyzed by qualitative content analysis. The analysis resulted in a description of the adolescents' experiences of maltreatment and of the
camp and post camp. Yoga does influence our thinking, emotionality and functioning. Hence it can be created for optimal physical and emotional well-being.

**Suzanne Willard (2006)**

Medications are an intentional and purposeful means to the successful management of many chronic diseases. In the treatment of disease caused by HIV, adherence to medication is of particular concern because any level of non-adherence, often a few missed doses, will lead eventually to the development of drug resistance. Much predict therapy in individuals who are infected with HIV. EI is defined as the ability to perceive and express emotions, facilitate emotions, understand and reason with emotion, and manage emotions. EI has been correlated with various aspects of success in life. In this study, EI was measured by the Mayer, Salovey, and Caruso Emotional Intelligence Test. Adherence to medications was measured by self-report and defined as less than 10% missed doses of medications. Eighty-two participants were recruited from an urban hospital-based HIV clinic. Pearson’s r was used to analyze the data for significance, and no correlation was reported. This data set was not large enough to prove significance, statistically, of the research question. However, an unexpected result of this study was that the overall EI scores for this particular population were markedly lower than the test norms. Further study would be warranted and recommended to explore EI measurement in people at risk for HIV disease or in those who have the disease to further understand the impact of emotions and EI in this specific population. Poor adherence to HIV medications have been identified as significant factors in adherence. Among these is the emotional aspect. The purpose of this study was to examine emotional intelligence (EI) and adherence to combination antiretroviral

**Kumar Ranjian (2008)**

Yoga is a perfectly structured and integrated worldview aiming at the transformation of human being from his actual unrefined form to a perfected form, it has technique for attitudinal change, behavioral modification and integrated development of personality the approach of yoga is spiritual cum worldly. Yogic principle and their practice are most effective, practical and universally accepted to achieve the highest goal of life.

**Statement of the problem**

The problem of the present study is “A Study of The effect of Psycho-Spiritual Package on Loneliness, Insecurity and Emotional Intelligence in Street Children”.

**Variable**

**Independent Variable-**

Psycho-Spiritual Package
Psycho- Spiritual Package

The psycho spiritual package is a combination of spiritual or yogic and psychological and yogic practices. Spiritual is a divine that enters our thoughts, actions, desires, emotions and aspirations. The practice of yoga is based upon the present psychological position of individual. Yoga and spiritual practices is believed to help the practitioner transcend all pains and miseries only if he is moderate in food in and awakes on time.

Asana (Pragya Yoga)

In the yoga sutras of Patanjali there is a concise definition of yogasanas “Sthiram Sukham Asanam” that position which is comfortable and steady”. In this context, asana are practiced to develop the ability to sit comfortably in one position for an extended period of time.

Pandit Shri Ram Sharma Acharya, who was a seer’s age of the present age, had presented a stream of yoga, which is simple and suitable for the masses today. This is referred as “Pragya yoga”.

The main series of asana practice including in Pragya Yoga would help controlled movements for strengthening the nerves, muscles and different organs and regularizing the blood supply in all parts of the body. Pragya yoga has sixteen steps. They are Tadasana, Pad Hastasana, Vajrasan, Utkatasan, Yogamudra, Ardh tadasan, Shashankasana, Dhyuagasan, Triyak Bhujangasan (left & right), Shashankasana, Ardh Tadasan, Utkatasan, Padhastasana, and Tadasan, at last 16 steps coming back to original position with a deep chant of Om.

Pranayama (Pranakarshan Pranayama)

When the body is regulated by Asana, one should begin the next stage of pranayama; pranayama is more than simple breathing exercise. It is comprised of words Prana and Ayama, which means “Pranic capacity”. It is not only breath control but also a technique through which the quantity of prana in body is activated to higher frequency. Pranayama is a practice of deep and harmonized breathing, and pranayama help inner purification as well as tuning of inner emotions and are also useful for seekers of spiritual sadhanas. Pranakarshan Pranayama is a precious gift, which was offered by Pandit Shri Ram Sharma for our well-being and mental and spiritual evolution. In Pranakarshan pranayama practitioner takes these steps. They are –

- Be seated in a relaxed position keeping back straight.
- With both hand on the lap.
- Now inhalation a deep breath that’s called Pooraka.
- After that internal breath retention that’s called Antar kumbhaka. In this stage holding the breath inside.
- After that exhalation that’s called Rechaka. In this stage exhaled the air.
- At last external breath retention that’s called Bahir kumbhaka. In this stage holding the breath outside.
By practicing pranayama Pranic energy levels will rise and help strengthen the personality and inner self.

**Meditation with Music Therapy**

In India, often the term dhyana is used equivalent to meditation in most contexts we perceive, or refer to a person sitting cross-legged, with closed eyes, in a peaceful and quiet environment, may be with or without some gesture of hand (mudra) or rosary in the hands. Habitually we connect it with religion and spirituality.

At present, hectic pace and increased mechanized lifestyle are exhausting on everyone, and then body and mind need peace and silence. At that time meditation with music plays an important role in keeping up the mental and physical health of people in general.

Sollberger, Rebar and Eckstein, 2003, have the opinion that: When listeners hear pleasant sounding chords preceding a word, they are faster to respond that a word such as charm is positive and they are slower to respond that a word such as evil in negative. Music has been shown to have physiological effects. High levels of the neurotransmitter serotonin (which is targeted by many antidepressant drugs, such as Prozac) are responsible for negative aspects of emotion and mood.

When people listen to disagreeable music, their levels of serotonin actually rise.(Evers and Suhr 2000). When people listen to highly pleasurable music, they experience changes in heart increases in brain regions that are thought to be involved in reward and motivation. (Blood and Zatorre 2001) Indeed, music is a powerful human invention.

Music therapy which used sound as the object of concentration is effective in helping with a variety of problems; the specific concentration technique is prescribed according to the disorder. There are two types of sounds the sounds created in external world and another set of unalloyed sound coming from within us as a result of vibrations of various energy channels overlapping from all over the body. These latter sounds are sometimes experienced in the deeper states of meditation and this leads the mind to attain higher dimensions of consciousness. In the yoga manuals this is called anahad nada.

The western world is slowly becoming aware that music has powerful and potentially therapeutic effects on humans as well as on animals and even plants.

Music therapy has been mostly used on those who were emotionally unstable and immature which gradually develop emotional control.

**Swadhayaya**

Indecision, disbelief and lack of inspiration are an integral part of our existence and one have to learn to deal with them. We should learn to cope with these conditions without letting them affect. Swadhayaya self-study or self-analysis is a practice which should be followed by the aspirant throughout his life. It may not always be possible to avail oneself of the discourses of wise men but “spiritual texts can be studied at all time and in all places. When our spiritual convictions and inspiration are in jeopardy. We should use Swadhayaya as a means to revive our faith and re-establish equanimity”. Swami Satyananada Saraswati (1984).
According to M.T.Moti (1997) "Swadhyaya is made up of two words, Sva i.e. self and Adhyaya i.e. Study. One has to study, and acquaint with the knowledge about the self."

Swadhyaya is meditative reading or recitation by and to and oneself. Proper means, Proper effect, proper end specify the nature of swadhyaya. This not only provides stock of knowledge but also it is useful in further spiritual purpose.

Reciting the significance of swadhyaya based on Patanjali Yoga Sutra Swami Chidananda (1998) narrates "This is a process which will be available to you constantly, available to you always, wherever you are" Swadhyaya constant is taken of spiritual ideas through daily study. Gradually there comes about process of mind transformation, the old mind is gradually eliminated and a new mind is created within us. It always thinks spiritually and always be in a state of awareness.

Psychologically Swadhyaya help us by creating a permanent background of thought, though when we are disengaged from outer occupation, we do not fall on prey like all types of chaotic, miscellaneous thoughts which are crowding in mind. When we swadhyaya at night, one way or in other all these thoughts will be washed away.

**Group counseling**

Counseling is interactions between a counselor and one or more clients. The purpose is to help the client with problems, may have aspects that are related to disorders of thinking, emotional suffering, or problems of behavior. Therapists may use their knowledge of theory of personality and help the client improve functioning.

According to Gelso and Frelz (1992) "Because human beings live in groups, most of their satisfactions and dissatisfactions develop out of the features of group living. Counseling must take into consideration the orientation of the individual the group. Since a part of client's difficulty is his inability to behave toward other. People in an emotionally satisfactory manner, it is clear that the group may be used as counseling's unit through with client may be reeducated in the techniques of group emotional interchange".

In group counseling the aim is to provide the client with an opportunity to discuss their problems together in an atmosphere free from constraint. Once the self consciousness has been overcome, the client find it possible to relieve their feelings of isolation and rejection. Exposure to the problems and experiences of others has been helpful in modifying a too, strict conscience, in developing a sense of acceptance, and in gaining more satisfactory and normal interpersonal relationship.

**Dependent Varibles**

- Emotional Intelligence
- Insecurity
- Loneliness

**Emotional Intelligence**

The Greek philosopher Aristotle had a recipe for handing relationships smoothly. You must be able, he said, "to be angry with the right person, to the right degree, at the right time for the right purpose and in the right way."
Emotional intelligence refers to a combination of skills; these include empathy, self-control, self-awareness, sensitivity to the feeling of others, persistence and self-motivation among others (Salovey & Mayer, 1997).

According to Hein’s (2005) “Emotional Intelligence is the innate potential to feel, use, communicates, recognizes, remembers, manages and understood emotion.”

According to David Caruso (2004) “Emotional intelligence is the ability to accurately identify emotion, manage to stay upon these emotions in order to capture the wisdom of our feeling.”

According to Mayer and Cobb (2000) “Emotional intelligence is the ability to process emotional information particularly as it involves the perceptions, assimilation understanding and the managing emotion.

Psychologist and the New York Times writer Denial Goleman (1995) - A lack of emotional intelligence can run careers and sabotage achievement. Perhaps the greatest tolls fall on children and teenagers. Poor emotional skill can contribute to depression, eating disorders, unwanted pregnancy aggression, insecurity and violent crime.”

Psychologist Robert McCall (1997) “Echoes the views of other psychologist when he says that, “There are so many hours in a days, and one of the characteristics of American schools is we’ve saddled them with teaching driver’s education, sex education, drug education and other skills, to the point that we don’t spend as much time on academics as other countries do. There may be consequences for that.”

### Insecurity

Every human being has problem and troubles in life but they reacts to them differently. Any problem which may disturb very much to an individual might be of no importance for other one. This develops the feeling of insecurity and security among the people which influence very significantly in shaping and reshaping the personality of an individual.

Insecurity is:

- Feeling of not being “good enough” to meet the challenge of a situation you face in life.
- Sense of helplessness in the face of problems, conflict, or concerns.
- Belief that one is inadequate or incompetent to handle life’s challenges.
- Fear of being discovered as inadequate, ill fitted, or unsuited to meet responsibilities at home, school, or the job.
- Sense of not fitting in, being “out of synch” with those in your peer group.
- Perception that life is unpredictable with most of the expectations you have to meet not clearly understood.
- Sense of always climbing up a mountain, never being able to reach the top.
- Sense of lacking support or reinforcement where you live, work, or play.
- Results from a sense of being unaccepted, disapproved, or rejected.

According to Elizabeth B. Hurlock (2002) “Feeling of insecurity are almost universal among the upwardly mobile. While they also affect the person who is static. They are generally related to situations for which the individual has been unprepared or in which he has met with failure, for the mobile, by contrast. Insecurity becomes a generalized feeling; it affects all aspects of life, but is most damaging in the area of social relationship."

Generalized insecurity comes from the necessity of giving up old friend and associates and relinquishing the value that have served as lifetime guides. The mobile are identified neither with the old
nor with the new. They lack firm ties with the group they are leaving behind and have not been able to establish similar ties in the new group. C.F. Murray (1998) “Any thing in the individual that is below the overage, that provokes unfavorable comment or gives him a feeling of impotency or ineptitude and social and interpersonal deprivations are help to be such factor.”

Loneliness-

Loneliness is a negative experience of human. It’s a part of Aloneness. It subsumes a number of negative separation experiences. When we are lonely, we suffer because of our longing for a relationship. This longing may be for another person or group, or it may be for a way of life or for a part of us that has no opportunity for expression. According to Dr. Carl Jung “Loneliness does not come from having no people about one, but from holding certain views that others find inadmissible.”

Late Dr. Ralph Audy Ph.D. M.D. of the U.C.L.A medical center in San Francisco states “Loneliness is not just a physical condition, it is primarily an experience. Furthermore, it is probably unique to mankind.”

Adolescents more experience loneliness feeling, when they are alone between the groups (Larsen & other, 1982). Males and females feel lonely under some different circumstance. Males when isolated from group interaction, females when deprived of close one-to-one relationships (Berg & Mequinn 1988, stokes & Levin, 1986).

The first and most outstanding feature of loneliness is a painful feeling, some times experienced as a sharp ache, as in moments of grief of separation, but it can also be a dull lingering from of stress that seems to tear a person down. A chief element of loneliness is painful feeling that tells us some thing unpleasantly important about ourselves.

Objectives of Study

- To study the effect of psycho-spiritual package on the level of emotional intelligence of street children.
- To study the effect of psycho-spiritual package on the level of insecurity of street children
- To study the effect of psycho-spiritual package on the level of loneliness of street children.

Hypotheses

- The Psycho-spiritual package significantly increases the level of emotional intelligence of street children.
- The Psycho-spiritual package significantly decreases the level of insecurity of street children.
- The Psycho-spiritual package significantly decreases the level of loneliness of street children.
- The Psycho-spiritual package significantly increases the level of emotional intelligence of male street children.
- The Psycho-spiritual package significantly decreases the level of insecurity of male street children.

- The Psycho-spiritual package significantly decreases the level loneliness of male street children.

- The Psycho-spiritual package significantly increases the level of emotional intelligence of female street children.

- The Psycho-spiritual package significantly decreases the level insecurity of female street children.

- The Psycho-spiritual package significantly decreases the level loneliness of female street children.

**Note:** Sub Hypotheses may be developed during the course of the study.

**Method**

The study would be conducted in to two phases-

**First phase**- In the first phase the test of insecurity & loneliness would be developed and also the norms of Emotional Intelligence will be prepared..

**Second phase**- In the second phase an empirical study will be conducted on street children population.

**Research Design**

The design of the study is **Pre-Post Single Group** Design. The experimental group will be given practices of psycho-spiritual package.

**Sample**

Quota sampling will be adopted for the selection of the samples. The total sample will be of 60 street children, 30 male and 30 female. The range of age would be from 13 to 17 years.
Sample Structure

Street Children 60

Male 30
- Home living Male-15
- Running away from home Male-15

Female 30
- Running away from home Female-15
- Home living Female-15

Psycho-Spiritual Package

Duration- 45 Days
Daily Practice- 70 minutes

Schedule of package

Asana (Pragya yoga) 15 minutes daily
Pranayama (Pranakarshan) 10 minutes daily
Meditation with Music 10 minutes daily
Group counseling 25 minutes daily
Swadhayaya discussion 10 minutes daily

Research Tools

- Emotional intelligence – Anukool & Srijot Delhe test and Norms Self Develop
- Insecurity Test – Self develop questionnaire.
- Loneliness Test - Self develop questionnaire.

Willard Suzanne (2006), Relationship of Emotional Intelligence and Adherence to Combination Antiretroviral Medications by Individuals Living With HIV Disease, Journal of the Association of Nurses in AIDS care, Volume 17, Issue 2, March-April Pages 16-26
INSECURITY
(असुरक्षा)

Insecurity एक नकारात्मक भाव है। यह व्यक्ति को असुरक्षित होने का अनुभव कराती है। यह असुरक्षा की भावना जीवन के किसी भी क्षेत्र में हो सकती है। जीवन की चुनौतियों का समाप्त नहीं कर पाने से, किसी समाज तथा हैन्द में अपने को सरल रूप से, घर, स्कूल या नौकरी में अपनी जिम्मेदारी को निभाने में असफल समझने से, गिनियों के मूल्य अपने की योग्यता से समझने से, नम्बर अन्य कारणों से व्यक्ति में जो नकारात्मक भाव उत्पन्न होता है, वह असुरक्षा की भावना कहलाती है। यह भावना है जो व्यक्ति को असुरक्षित होने का एहसास दिलाती है।

FAMILY- INSECURITY- परिवार के मध्य व्यक्ति को ज्ञात के लिए जो असुरक्षा का एहसास होता है। यह Family Insecurity कहलाता है।

PEER GROUP -INSECURITY—भिन्न हेतु व्यक्ति को जो संबंध के लिए असुरक्षा का एहसास होता है वह PEER GROUP -INSECURITY कहलाता है।

ECONOMIC -INSECURITY— आर्थिक असंपन्नता तथा शिक्षा में पिछड़ने या शिक्षा के अभाव के कारण व्यक्ति में जो असुरक्षा का भाव उत्पन्न होता है वह आर्थिक Insecurity कहलाता है।

EMOTIONAL- INSECURITY— परिवार तथा धनियों या उनके अभाव के कारण आघात से उत्पन्न असुरक्षा का भाव Emotional Insecurity कहलाता है।
Insecurity Scale

मैं शीघ्र निराश हो जाता हूँ।

निर्णय लेने में अक्सर मुझे कठिनाई होती है।

मुझे सिर में दर्द/भारीपन अथवा दबाव की अनुभूति होती है।

मुझे अपनी योग्यता पर विश्वास समाप्त होता जा रहा है।

मुझे अपनी शारीरिक बनावट के कारण असहजता महसूस होती है।

अकारण मुझे अपने आप पर क्रोध आ जाता है।

मुझे लगता रहता है कि मुझे मेरे किसी अपराध का दण्ड मिलने वाला है।

जरा सी आहत से मैं चांक उठता हूँ।

मुझे लगता है कि मेरे आस-पास के लोग मेरी भावनाओं की अवहेलना करते हैं।

असफलता के भय के कारण मैं कोई योजना नहीं बना पाता हूँ।

मुझे लगता है मेरा भविष्य अन्धकारसम य है।

मेरी भावनाएं छोटी छोटी बातों से भी आहत हो जाती हैं।

मुझे लगता है मेरी कमजोर परिस्थितियों के कारण मेरे सहयोगी मुझ पर रौब डालने का प्रयास करते हैं।

मैं यह सोचकर परेशान रहता हूँ कि मेरे साथी मेरी आर्थिक रिश्तियों को उत्जागर न कर दें।

मुझे नकारात्मक विचार दर समय परेशान करते हैं।

मुझे लगता है कि इंशायेर ने मेरे साथ अन्याय किया है।

मुझे मेरी परिस्थिति के कारण दूसरों से मिलने में हिचकिशाहत होती है।

भविष्य की चिन्ता के कारण मैं कोई कार्य ठीक ढंग से नहीं कर पाता हूँ।
LONELINESS
(अकेलापन)

Loneliness एक नकारात्मक अनुभव है। Loneliness यह नकारात्मक अनुभव है जो अकेला को अकेलापन तथा असहाय होने का अनुभव करता है। Loneliness, Aloneness का एक भाग है। Aloneness के दो भाग हैं- 1. Solitude 2. Loneliness

Solitude, Aloneness या सकारात्मक भाग है, जिसमें व्यक्ति स्वयं के विकास के लिये अपनी सूतिभावनाओं के अनुकूल अपने जीवन निर्वाचित रखते हुए अलग करता है। इसके लंबे समय व्यक्ति की किसी के प्रति तथा स्वयं के प्रति रोक नकारात्मक भाव नहीं होता है।

नकारात्मकness, Solitude के विपरीत होता है। यह Aloneness का नकारात्मक भाग है। यह व्यक्ति को इससे अनुभूति द्वारा तथा स्वयं के अनुभव से प्राप्त अनुभव है। व्यक्ति को स्वयं के पति-पत्नी-परिवार के नकारात्मक व्यवहार के साथ तथा समाज में कभी नकारात्मक व्यवहार के साथ व्यक्ति में अकेलापन के नकारात्मक भाव को उत्पन्न करता है, तथा यह अकेलापन की भावना का अपने को असहाय होने का Loneliness कहलाता है।

अतः नकारात्मक अनुभवों का संगठन जिसके कारण व्यक्ति अपने को अकेला तथा असहाय मानता है वह अनुभव Loneliness कहलाता है।

FAMILY LONELINESS- परिवार के अनुभव तथा निरस्कर्ष से स्वयं के लिये उत्पन्न अकेलापन की भावना Family Loneliness कहलाती है।

EMOTIONAL LONELINESS- व्यक्ति को प्राप्त भावात्मक उपेक्षा तथा निरस्कर्ष जिसके कारण वह अपने को अकेला तथा असहाय महसूस करें Emotional Loneliness कहलाती है।

PEER GROUP LONELINESS- व्यक्ति समाज तथा निरस्कर्ष के गठन प्राप्त उपेक्षा तथा निरस्कर्ष जिसके कारण वह अपने को अकेला तथा असहाय महसूस करें Peer Group Loneliness कहलाती है।
