Objectives

The present study is aimed to study the effects of EMR in following ways.

1. To measure the power radiated by tower.
2. To make survey of people staying near mobile tower about their health problems
3. To evaluate the effect of mobile phone on cardiac electrical activity by examining various parameter of the heart rate variability.
4. To study effects of tower radiations on heart rate variability.
5. Study the effects of electric tower of high tension line on heart rate and respiration rate.
6. To study the effect of geopathic stress on human system by recording blood pressure (BP), heart rate (HR) at locations of the geopathicstress(GS) and non geopathic stress.
7. To select statistical method to find whether the change due to various stresses is significant or not
8. To suggest possible remedies to avoid ill effects of EMR
