2 Research Methodology

A research topic requires a well defined and suitable methodology in order to get maximum problems. Therefore, the researcher will collect, select and analyze the secondary data to get the problems. The research is both qualitative and quantitative in its nature. The qualitative approach applies to both, descriptive and inductive forms of research. While as in case of quantitative approach, an extensive use will be made of the literature available to carry out a detail research on the nature of problem. To carry out the study, one has to collect data from those libraries. Random sample method can be used for this research.

A questionnaire will be prepared for proposed research for librarians to get the appropriate data. Here, the researcher will describe the answers given by the librarians to find out the problems. Thus, the primary and secondary data and their practical study will help to arrive at the conclusions. The collected data then will be tabulated and analyzed in order to present the whole picture of study at a glance.
