Methodology

The methodology to implementing the proposed system is divided into two stages:

A. First step is Planning

1. During the process various architectures will be identified.

2. The functionalities of central repository system will be studied individually.

3. General architecture of the proposed research will be planned on the paper.

B. Second step is Executing

1. During this process various architecture will be studied in detail to overcome the problem of Increasing Data storage capacity, so that data is transmitted efficient.

2. Various cloud computing techniques will be studied to find a suitable way of optimizing data.

3. Designed architecture for saving large volume of data with ensuring security of the platform, applications and data.

4. The environment for implementation the cloud platform that will reduce in the operational costs, by enabling any organizations to share infrastructure, platform services and resources.
