RESEARCH METHODOLOGY

Doctrinal method of the research has been adopted for the present research, where in apart from the customary method of referring the magazines, journals, books regarding ethical issues, legal websites, and the even personal approach to the victim as well as medical and allied health professionals.

The research design contains the following steps

Theoretical analysis

Data collection

Survey

Work plan and methodology

Research methodology helps to study the various steps that are generally adapted by researchers in studying the research problems. It includes operational definition, research approach, research design, setting of the study, description of population, sampling technique, development of tool, procedure for data collection and the plan for data analysis. For this study, descriptive research model is used and the data will be collected by using both primary\secondary sources. The primary data will be collected by personal approach to the victim as well as technical experts from medical and allied health workers from South Asia and Middle East countries (questionnaire prepared and collected hundred individuals from each countries), and secondary data collected from journals, reviewed articles and other publishes regarding this matters from governmental and non governmental sectors.
