2 Method of Study

3.2.1 Descriptive or survey method

In the present study the research scholar will used descriptive method or survey design. Descriptive method is that method of research study in which the characteristics of a group, community or people are described. The methods used for this design is qualititative in nature. That data produce is descriptive one. Information from participants, their observation, personal attributes and unstructured interviews are some of the techniques used in descriptive studies. The steps to be followed in the descriptive design are:-

1) Formulating the objectives of the study.
2) Defining the population and selecting a sample.
3) Designing the methods of data collection.
4) Analysis of data.

In the descriptive design the main object of the study is to collect knowledge. It is not concerned with the solution of the problem.
