MATERIALS AND METHODS

- Fields Survey of Ethnomedicinal plants has been carried in the different villages of Jhunjhunu.
- Regular recording of the information collected about the medicinal plants in the field note book.
- Photography of the identified plants in the field itself and then in the Laboratory.
- The ethnobotanical information has been collected through several informal interviews and discussions with the herbal practitioners in villages of Jhunjhunu.
- Preparation of herbarium sheets for the collected samples.
- Identification and classification of ethnomedicinal plants in the study area by proper identification methods (Jain and Rao, 1977).
- Listing of traditional healers and Vaidyas in villages of Jhunjhunu area. Their interviews with the help of a detail questionnaire.

There is a need to document the information of plant species being used by rural population and the traditional healers as a consolidated data for further studies. Since proper information is not available in detail, the present research will help in the process of documentation regarding the villages of Jhunjhunu.
