Hypotheses:

In the present study researcher has undertaken the following hypotheses:

1. There is significant correlation between the mental health of B.Ed. trainee boys and girls with teacher behavior.
2. There is significant correlation between the mental health of B.Ed. trainee boys and girls with social status.
3. There is significant correlation between the mental health of B.Ed. trainee boys and girls with economic status.
4. There is significant correlation between the mental health of English medium B.Ed. trainees with teacher behavior.
5. There is significant correlation between the mental health of English medium B.Ed. trainees with social status.
6. There is significant correlation between the mental health of English medium B.Ed. trainees with economic status.
7. There is significant correlation between the mental health of Marathi medium B.Ed. trainees with teacher behavior.
8. There is significant correlation between the mental health of Marathi medium B.Ed. trainees with social status.
9. There is significant correlation between the mental health of Marathi medium B.Ed. trainees with economic status.
10. There is significant correlation between the mental health of Hindi medium B.Ed. trainees with teacher behavior.
11. There is significant correlation between the mental health of Hindi medium B.Ed. trainees with social status.
12. There is significant correlation between the mental health of Hindi medium B.Ed. trainees with economic status.

Assumptions:

1. Mental health of B.Ed. students generally depends upon the teacher behavior.
2. Mental health of B.Ed. students generally depends upon the social status.
3. Mental health of B.Ed. students generally depends upon the economic status.
