3.2. OBJECTIVES OF RESEARCH WORK:
It is my prime objective to develop Microsponge loaded Topical drug delivery system that:
Modified Release the drug for prolonged period of time.

1. Localization of the drug without being absorbed into systemic compartment which may avoid the systemic side effects.
2. Provide an increased residence time within the epidermis by reducing its transdermal penetration into the body.
3. Controlled/ modified release of drug at specific site and hence dose and dose frequency can be decreased thereby obtaining greater therapeutic efficacy.
4. Show better in-vitro performance than conventional dosage forms.
