Objectives

The objectives of this study were to assess the long-term effects of a direct spray application of an azadirachtin commercial insecticide formulation and complete neem seed oil against multiple life stages pests. The major objectives will be to explore:

1. What is the developmental stage, of pest or larvae at which the normal process of biocontrol is use.

2. Are there any variations in the composition of major macromolecules on neem based products, use the bio control agents.

3. Are there any detectable differences in the use of proper dose or concentration of use of bio insecticides on vegetable and fruit crops for increase production.
