OBJECTIVES OF RESEARCH

The main objective of the present study is to study the impact of water percolation tank on ground water table and cropping pattern. On the basis of this it is further aimed to suggest the meaningful suggestions for the development of agriculture in the study area. This is viewed in the light of the following specific objectives.

1. To study the geographical background as the basis for agricultural development in the study area.

2. To study the spatial distribution of water percolation tanks in the study area.

3. To analyze the impact of water percolation tank on ground water table of selected case studies.

4. To analyze the impact of water percolation tank on cropping pattern in the study area.

5. To suggest meaningful suggestions for the development of agriculture in the study area.
