OBJECTIVES OF RESEARCH WORK

The objective of the present study is;

1. To develop some micro particulate drug delivery of the systems of the some anti-hypertensive drugs like Bosentan and Toresemide which helps to increase the sustained action.

2. To increase the duration of action of the anti-hypertensive drugs to achieve control release pattern of drug release which may in turn lower the dose strength and also it may increase bioavailability of the drug and hence enhance patient compliance.

3. To decrease the dosing frequency which helps to prevent side effects of the drugs.

4. To show better in-vitro performance than conventional dosage forms.
