OBJECTIVE

- The present invention relates to jellied medical composition for oral administration, specifically to a jellied medical composition for oral administration which is easily taken by patients of advanced age or patients with dysphagia.

- To solve medical problems in the aged society. One of the problems of such medicine for the aged is great difficulty for patients of such advanced age in taking any of currently used dosage forms of medical compositions for oral administration.

- To avoid bitter taste, first pass metabolism of drug and improve bioavailability of drug as well as immediate onset of action, as well as palatability specially small children. The medicinal sciences have always aimed at an increased effort to increase the patient safety & reduce medical error which is mainly due to therapeutic failure and adverse drug reactions.

- Ofloxacin and ornidazole mainly used in the treatment of anaerobic infections, trichomoniasis, amoebiasis, giadiasis and also used as antimicrobial agent. This both drugs having extremely bitter taste. This drugs mainly used in treatment of pediatric and geriatric patients, both are not easily swallow the medical preparation like tablets, capsule and liquid preparations upon oral administration. To overcome such problems the medicated jellies will be prepare.
