HYPOTHESIS

The proposed research is underway to explore the use of different technical methods in the incremental short text summarization on comment streams from social network services. This system considers each hypothesized solution and will prove outcome of the case. Motivated by the fact that users may desire to get a brief understanding of a comment stream without reading the whole comment list, we attempt to group comments with similar content together and generate a concise opinion summary for this message. The case-specific data includes both the data provided by the user and partial conclusions.

In this, we will address the following questions.

1. How to take the decision about effective short text summarization result?
2. Which method is used for high efficiency clustering results?
3. Which techniques are used for impressive summarization results?
