OBJECTIVES

Our research work targets towards the main objective of constructing novel and efficient VC method, to be used in secure secret sharing mechanism. This main objective will be achieved with following functional objectives:

- To determine performance metrics for measuring the performance of VC techniques.

- The analysis of existing methods and their implementation to be examined to boost the performance in terms of one or more measures.

- To observe performance with optimal performance in restricted scenarios.

- To examine the dataset or nature of images in the experiments as per the requirement of one or more number target applications.

- To embed new methods with computational intelligence to make them more flexible and suitable for any type of applications, having control over the refinement of individual performance measures.

- To use the modified system for privacy protection of images.
